Gpt - 5 dataset - Benchmark summary

Model: gemini-3-pro-preview
Cases: 35
Successes: 25

nMAE (mean / median, n=23) 0.1473 / 0.1044
L1 normalized (mean / median, n=23) 0.1105 / 0.0742
Duration seconds (mean / median, n=25) 106.4 / 106.6
Series count mismatches (extracted vs GT): 0

Gpt - 5 dataset - Benchmark summary - Prompt

```
 You are an expert system that extracts NUMERICAL data from 2D scientific plots. You must
return ALL visible series from the given image.  Rules: - Do not guess or invent data. -
Work in three internal steps (do NOT show them):   1) Read axes:      - Determine x_min,
x_max (detect log10 if any).      - Determine y_min, y_max (detect log10 if any).      -
List visible tick labels for x and y (as numbers).   2) Identify all visible data series:
- For discrete markers: read their positions and map to axis coordinates.      - For
continuous curves: sample >= 20 points (include local extrema, inflections, and uniform
samples).   3) Validate:      - Ensure x in [x_min, x_max], y in [y_min, y_max].      - For
linear axes, reject perfectly uniform sequences unless they exactly match tick labels.
- If uncertain about a point, omit it. Never invent.  Output format (STRICT JSON, no extra
text): {   "series": [     {       "label": "<legend name if visible else 'series_N'>",
"points": [         {"x": <float>, "y": <float>, "confidence": <float 0..1>},         ...
],       "axis": {         "x": {"min": <float>, "max": <float>, "scale": "linear"|"log10"},
"y": {"min": <float>, "max": <float>, "scale": "linear"|"log10"}       }     },     ...   ]
}  Additional rules: - Include ALL visible series. - Keep points sorted by increasing x. -
Use at least 20 points for continuous curves if readable; otherwise return all discrete
markers. - Never include explanations, placeholders, or text outside JSON.
```
